

For the use of water resources in Syria

(Article from Al Baas newspaper. 11/25/81)  
(In Syria and the Arab World.vol.335. 1/25/1982)

The necessary studies that cover more than 5 million hectares in the 4 areas of Damas, Oronte, littoral and Alep come out with the following results:

-map describing the bed's limits, their tributary rivers and their flow.

-An estimate of the underground water quantity below the beds of the rivers.

-The relationship between the surface water and the underground water.

It was decided to establish a general plan that should be technical and economic for the use of the existing water resources, and at the same time put the basic rules to protect these resources from waste, salinity, and pollution.
