The Statistical Abstract, presents, like its predecessor and society in Israel. The data planners, researchers and the

Most of the current series presents a historical Summary divisions, which shows the

The Abstract presents data from various publications of the Census of Population and Housing Statistics, etc. Lists of these are given in this Abstract's chapters.

Of the subjects included in this year should be made of the population of the Gaza Area — up to 200,000. Habits for 1987; data from a survey of 1985, which covered subjects that should also be made of the data from the Bureau towards the 1980s. In the present: one of these subjects is the Survey of Commerce and

The material for the Abstract is made of information from various institutions.

This year too, Mr. Zeev Ben-Zur is publishing of the Abstract under the supervision of the Bureau, under the supervision of the "Hamakor Press" Ltd.

To all those who participate in the Survey of Statistics conveys its appreciation.

Jerusalem, 1987

## CHAPTER VI NATIONAL ACCOUNTS

### GENERAL

The national accounts which are presented in this Abstract, were compiled in a new format, which were recommended by the Statistical Office of the United Nations<sup>2</sup>. The differences in definitions and classification between the present and the previous systems influence mainly the absolute size of the product and its components. However, there is no significant difference in the annual changes, of each component. The main difference in the classification of uses of resources is in the division of consumption expenditure between private and general government. In the new system, general government includes — beside consumption of government, local authorities and national institutions — also consumption of non-profit institutions, whose main expenditure is financed by the government. In the previous system of the accounts, consumption expenditure of non-profit institutions was included in private consumption, irrespective of the mode of financing this expenditure.

In the new system, all households' payments to general government for services provided are included in private consumption, including nominal payments that do not cover the cost of the service. These payments were previously considered as transfer payments to the government and were included in general government consumption. As well as the changes in classification, the following items were added to general government consumption (and consequently, also to the product): (a) expenditure on depreciation of buildings and equipment used in services provided by the public sector; (b) imputed expenditure, that reflects the government's obligation to pay retirement pensions to its retired employees.

A detailed explanation of the differences between the present and previous systems was published in *Monthly Bulletin of Statistics — Supplement*, no. 5, 1987.

Israel's national accounts include as of June 1967: (a) the economic activity of East Jerusalem; (b) economic transactions of Israel subjects with Judea, Samaria and the Gaza Area, the measuring of these activities being based on gross evaluations.

### DEFINITIONS

*Gross domestic product at market prices*<sup>3</sup>: The market value of the product, before deduction of

provisions for the consumption of fixed capital, attributable to the factors of production employed in Israel. It is equal to the sum of consumption expenditure and gross domestic capital formation, private and public, plus net exports of goods and services.

*Gross national product at market prices* is equal to the gross domestic product at market prices plus net factor incomes received from abroad.

*National income* is equal to the sum of compensation of resident employees, net income from property and operating surplus of Israeli residents. It is also equal to the gross national product at market prices after deducting depreciation and net indirect taxes.

*General government consumption expenditure* includes government offices' consumption, the National Insurance Institute, local authorities, national institutions and non-profit institutions where the above-mentioned bodies finance the major part of their expenditure. Their consumption expenditure is equal to the value of their intermediate consumption of goods and services, compensation of employees, consumption of fixed capital and indirect taxes paid.

*Private consumption expenditure*: The aggregate of private consumption expenditure of households and the consumption expenditure of non-profit institutions serving households, where the major part of their expenditure is not financed by the government.

*Final consumption expenditure by non-profit institutions serving households* includes consumption expenditure by non-profit institutions whose major expenditure is not financed by general government (see above definition of general government consumption expenditure).

*Final consumption expenditure of households*: Expenditure by resident households in Israel and abroad, on goods and services, including durable goods but excluding dwellings.

*Final consumption expenditure of households in the domestic market*. The available detailed statistical data relate to the combined domestic expenditure of Israeli residents and overseas residents. It is also difficult to obtain details on expenditure of Israeli residents abroad. Therefore it is possible to detail only expenditure of all households (residents and non-residents) in the domestic market.

*Gross domestic capital formation* is the sum of gross fixed capital formation and increase in stocks.

*Increase in stocks*: The market value of the physical change in: (a) Stocks of raw materials, work-in-progress and finished products held by resident industries; (b) Emergency stocks of important products held by the government.

The value of work-in-progress of buildings, roads and other constructions works, is regarded as "gross fixed capital formation" and not as increase in stocks. The physical change in stocks in the account period is valued as the difference between the levels of these stocks at the beginning and the end of the period, both valued at approximate average prices ruling over the period.

*Gross fixed capital formation*. The outlays (purchases and own account production) of industries, general government and non-profit institutions on addition of new durable goods to their stocks of fixed assets. Included are acquisitions of durable goods, except land, mineral deposits and the like, for civilian use; work in-progress on construction projects; capital repairs; outlays on the improvement of land and plantations. Excluded are the outlays of the government on durable goods for military use.

*Exports and imports of goods and services*. The value of goods and services that residents of the country sold or purchased from the rest of the world: it includes merchandise, transportation, insurance and other services. It does not include factor income of Israelis from abroad and factor payments to abroad. The value of imports of goods is recorded c.i.f., and consequently, the value of freight and insurance services provided by Israeli enterprises on imported goods is also recorded in exports of services.

*Net factor payments to abroad*: income of Israeli residents from investment abroad, like rent, interest, dividends and profits from direct investment of enterprises, earnings of residents working abroad and other income from work and lease abroad, less the corresponding factor income payments made to abroad. These items do not include payments and receipts of interest of the public sector and the Bank of Israel, which are defined as transfer payments.

*The product of the business sector* includes the product of all branches of the economy, except general government services, services of private non-profit institutions and housing services.

*Private disposable income* is equal to national income less direct taxes and less the government sector property income and plus net transfers to households from the government and from abroad.

*Net private savings* is defined as the difference between private disposable income and private consumption.

*Direct taxes* include current impositions by the government, the National Insurance Institute and local authorities:

- On income from wages, from property, from capital gains, entrepreneurship and from pensions, as well as impositions on financial assets, on net-wealth of enterprises and on ownership of goods.
- Payments to the National Insurance Institute — both by the insured and by the employer.
- Mandatory payments for Israeli passports, court fees, etc.

*Indirect taxes* are taxes imposed on producers in connection with production, sales, purchases or use of goods and services; these taxes are recorded by the producers as current production expenditure. Examples of indirect taxes are:

- Import taxes: customs duty, purchase tax, value added tax and tax on travel abroad;
- tax on domestic production: purchase tax, value added tax, business licenses, property tax and tax on labour. The operating surplus of government enterprises such as the post offices and ports, as well as that of enterprises owned by local authorities, e.g. water plants, is also defined as an indirect tax.

*Subsidies*: All grants on current account made by government and the local authorities to private industries and public corporations, as well as operation deficits of the government enterprises, such as the Israeli railways. In addition to the direct current subsidies, this item also includes the subsidy component in loans, such as loans from export funds, which are granted by the government to the producers under preferred conditions (interest rate lower than that of the market) for financing current activities.

On the other hand, the subsidy component embodied in non-recurrent loans or in loans which are not given on a regular basis, is not included in this item. The grant component in these loans is defined as capital transfers and is not included in the product account.

*Treatment of value added tax in the product account, at market prices*.

The product account at market prices does not include net indirect taxes on imports. Accordingly, the product account does not include value added tax (defined as indirect tax) imposed on imports. The value of uses of resources — private and general government consumption and investment — and imports, includes net V.A.T., i.e., only V.A.T. paid and not returned.

*Classification of product in the national accounts* is based on the Standard Industrial Classification of 1970, with the following differences:

<sup>2</sup> United Nations: *A System of National Accounts*, Studies in Methods, Series F, No. 2, New York, 1968.

<sup>3</sup> The definition of the product at market prices differs from the U.N. definition in that it excludes net taxes on imports and includes other revenue components received by the exporters.

**Agriculture.** In the National Account, the agricultural product is the difference between agricultural output of goods defined as agricultural produce, and inputs purchased from other branches. The classification is by goods and not by establishments (agricultural farms), which are classified in the *Standard Classification of All Economic Activities* by their main activity<sup>4</sup>.

**Ownership of dwellings.** The national product includes a special item, "ownership of dwellings", which does not exist in the Standard Classification. This item comprises income deriving from housing services, and includes net rent actually paid as well as imputed rent due from owner occupied dwellings, and rented dwellings whose tenants can obtain key-money upon leaving.

**Public and community services.** This section of the Standard Classification comprises all public and community services, both those supplied by general government and those supplied on a profit basis. In the classification of the national product, this section includes services supplied by government, local authorities, national institutions and private non-profit institutions. Services such as education and health, supplied on a profit basis, are included in *personal and other services*.

#### SOURCES OF DATA AND METHODS OF COMPUTATION

The national product was estimated by two principal methods: The "national expenditure" and the "national income" method. According to the first method, the national product is obtained by the addition of the expenditure on consumption and capital formation, and the total value of finished goods and services exported, after deduction of the value of goods and services imported. By the second, the "national income" is obtained as the sum of factor payments, i.e., salaries and wages and returns to capital, e.g., profits, interest payments and rents.

Conceptually, the two methods — the "national income" and the "national expenditure" — should, after deduction of net indirect taxes and depreciation, yield identical results. However, the two estimates shows certain discrepancies, due to the different statistical series underlying each approach and the different methods used. The difference appears in the summary tables as "errors and omissions" on the side of national income.

#### National Expenditure

**Private consumption expenditure.** The estimate of food consumption is based on data on the marketing of agricultural produce, data on the production and marketing of industrial food products and their corresponding prices. The estimate of the expenditure on industrial products other than food is based mainly on the family expenditure survey, on the current reports on revenue of industrial branches, on the enterprises' reports on domestic production of main durable goods (refrigerators, washing machines, televisions), and on foreign trade statistics.

The estimate of housing services is based on the increase in the area of residential building and on the change in the prices of residential services.

A considerable part of the estimates in the item "other services" is based on the findings from the family expenditure survey and on extrapolation for which various indicators are used for the years between the surveys. Other estimates (like electricity supply, bed-nights in hotels, visits to cinema, hospitalization in business hospitals) are based on the relevant quantity and price data.

The estimate of the value of the services of non-profit institutions is based on data on compensation of employees and other current expenditure. These data are obtained through questionnaires addressed to the institutions or are based on financial reports.

General government consumption expenditure is estimated by the analysis of the accountant general's reports, and of the budget provisions, using also complementary data received from the Ministries of Finance and of Defence. The estimate of the local authorities and the national institutions' expenditure is based on data obtained from the analysis of financial and budget accounts.

Estimates of gross capital formation in fixed assets are based mainly on the following:

- Data on imports of capital assets — machinery and equipment;
- Reports on revenue from sales of investment goods of domestic production;
- Quarterly estimates on area of building begun and completed;
- Financial data on investment in residential building carried out by the Ministry of Construction and Housing;
- Data received from governmental offices, public institutions and major enterprises on the extent of their investments.

#### Estimates on change in stocks are based on:

- Data on quantities of stocks of agricultural produce, fuel and vital products, such as meat and fodder, held by the government;
- Data from the industry and crafts surveys on the value of stocks held by enterprises;
- The estimate of the change in the stocks of diamonds is based on the difference between exports and imports at constant prices.

The estimate of imports and exports of goods and services is based on data from the balance of payments, adjusted to match framework and definitions of the National Accounts.

Constant price estimates for the continuous series of the product and its components at 1980 prices (Table VI/1), for 1950—1979 were compiled separately for each main expenditure item (consumption, capital formation, etc.) and for the Domestic National Product — according to the chaining of the annual quantitative changes, which were obtained at base year prices. Due to this chaining, the estimates of each component group of the product do not sum up to the total expenditure on the gross national product.

Quantitative annual changes obtained by this method may differ from the changes obtained on the base of weighting at preceding or current year prices.

Private consumption estimates at fixed prices were obtained either directly, by using data on quantities and base year prices, or indirectly, by adjustment of current values by the corresponding price index.

For public consumption estimates, quantitative changes in the expenditure on wages were computed according to the change in the number of workers; other current expenditures were generally deflated by the wholesale price index of industrial output, which was weighted according to characteristic production branches of the various expenditure items.

The gross capital formation estimate at constant prices was based on the building cost index and the equipment price index in Israel and in the principal countries of import.

#### National Income

The total national income is estimated by the summation of the income (net product) derived from each of the industrial branches.

In most branches (agriculture, industry, building, commerce), an estimate of total income accrued is obtained by deducting the estimate of purchased inputs from the output estimate. In other branches, income is measured directly by summing up payments to production factors, i.e., payments of wages and salary, interest, rent and lease fees and net profit.

#### REVISED ESTIMATES

Beside the changes in definitions and classification as specified above, corrections were made in estimates (as compared with previous years), reflecting use of updated figures, of additional sources and improvements in the measurement methods. The main revisions are specified below:

- The items of general government consumption expenditure were revised as follows:
  - receipt of the government's accounts, including those of the Ministry of Defence and the national institutions for 1985/86 and those of the local authorities for 1984/85;
  - a special survey on the activities of non-profit institutions in 1982/83, carried out by the Central Bureau of Statistics.
- The estimates of increase in stocks were revised on receipt of data from the "Industry and Crafts Survey 1983/84" and additional data from quarterly surveys for 1984 and 1985.
- The estimates of imports and exports of goods and services were revised in accordance with the revisions to the balance of payments, based on updated statistics for 1985. The main revisions to estimates for earlier years were:
  - Since 1980, estimates for undistributed profits from investments of Israeli banks in their subsidiary companies abroad were recorded in income from exports of capital services.
  - Since 1982, data on expenditure by Israelis abroad were revised, following revision of the base data.

Data on magnetic tape, that include about 200 annual and quarterly series of national accounts data as of 1950, are available by application to The Central Bureau of Statistics.

Quarterly estimates of expenditure on the G.N.P. appear regularly in the *Monthly Bulletin of Statistics*. Preliminary annual estimates are usually published in the No. 1 issue of the *Supplement* to that bulletin and revised estimates in the No. 5 issue.

Estimates of the national expenditure on education are presented in chapter XXII and on Health — in Chapter XXIV.

#### INPUT-OUTPUT

The tables present data from the input-output tables for 1980/81, at current prices. These tables are an updating of the basic table for 1977/78, which was also published at 1980/81 prices.

For detailed explanations of the input-output tables for 1968/69, 1972/73, 1975/76 and 1977/78 see Special Publications Nos. 171, 584, 599, 625 and 710.

<sup>4</sup> Qibbuzim are not generally considered as a single classification unit, but are divided according to activities, e.g. industry, agriculture, etc.

## EXPLANATIONS AND DEFINITIONS

*Updating the table.* The input-output tables for 1977/78 are based on the investigation of input and output of all branches of the economy, including primary inputs and final uses. On the other hand, the table for 1980/81 is based on the updating of parts of the 1977/78 table.

The updating was performed in two stages: In the first stage, prices were updated — direct coefficients of the 1977/78 table were corrected for 1980/81 prices according to relative price indices. This stage was conducted during the preparation of the 1977/78 input-output table and direct coefficients at 1980/81 prices were published in the 1984 Statistical Abstract. In the second stage, use was made of the coefficients of products whose prices were revised and further information was conveyed on the year of the updating (1980/81) — output by branches of the economy, final uses by branch of origin and primary inputs by branch of destination. In order to adjust total sources (the table's rows) to total uses (the table's columns) in each branch of origin, revisions are made in certain cells as well as computerized adjustments.

After the completion of these adjustments, differences have remained, resulting from errors and omissions which are included in the column of changes in stocks. In a basic table such differences are generally very small.

*The Tables' Structure.* Tables VI/13 — VI/14 are transaction tables describing, at current prices of 1977/78 and 1980/81, the inter-branch transactions and the transactions between the economic branches and the final uses. In these tables, each economic branch is represented by one row and one column. The row specifies the branch's sales in Israel (including competitive imports) for various uses (other branches, consumption, etc.), whereas the column specifies the branch's purchases (from other branches, from imports, expenditure on compensation of employees etc.). The transactions are presented in the tables at the producers' prices, i.e., prices which include subsidies and do not include expenditure on taxes, on marketing and on transportation.

The branches' classification generally corresponds to the bureau's classification of economic branches (1970). There are, however, some differences: Agricultural branches in the input-output table are classified according to groups of products and the services granted to them and not according to economic units, as are the instructions in the Standard Classification. In the construction branch, the classification is based on the purpose of the con-

struction and not on the organizational structure of the branch. There are also some differences in the definition of output. For instance, the output of the commerce branch is defined in the table as the sale of marketing services only, whereas the value of goods it sells is recorded in the table as direct sales of the production branches (agriculture, industry etc.) for the various uses (intermediate and final uses).

## SOURCES

The data used for the construction of the input-output tables are taken from the Central Bureau of Statistics' current series and from special researches conducted for the preparation of basic tables.

The information on which the 1980/81 tables are based is more restricted than the information for the 1977/78 tables. For instance, in 1977/78 data were obtained from the Industry and Crafts Survey, which contained also detailed information on sales by products and on purchases by materials, whereas in 1980/81 only data on total sales and on total purchases in each branch were investigated.

Data on outputs by branches are based on the following series:

*Agricultural branch* — production data, by products, out of current statistical agriculture; *industrial branch* — survey of industry and crafts 1980/81; *construction branch* — National Accounts data on capital formation in construction; *Transport branch* — reports of the establishments in the branch; *commerce and services branch* — extrapolation of 1977/78 output data according to the changes in the indices in the organized wholesale commerce and in the retail commerce and the data on private consumption in the services branches.

Data on final uses, classified by branches of source, were taken from the National Accounts data. A special analysis was conducted for imports, using the foreign trade and balance of payments data to determine the source and destination branches of imports.

*Taxes and subsidies.* The classification of taxes and subsidies by source and destination branches was conducted according to the Accountant General's reports, the 1980/81 industry survey and data of customs and excise duty. *Compensation of employees* — according to the above mentioned surveys and sources and data on wages, the source of which are the employers' reports to the National Insurance Institution. Further information on these sources can be found in the respective chapters of the *Statistical Abstract*.

## CHAPTER VII. BALANCE OF PAYMENTS

### DEFINITIONS AND EXPLANATIONS

The balance of payments is compiled according to the rules set down by the International Monetary Fund (IMF) and is defined as a systematic record of all economic transactions carried out in a given period between the domestic economy and the rest of the world.

Data since 1967 include evaluations of economic transactions between Israelis and non-Israeli residents of Judea and Samaria, the Gaza Area (and Sinai through 1982).

The balance of payments report consists of two main sections: a. The current account, which summarizes transactions in goods and services and unrequited transfers and b. Capital movements account, which includes also investments, changes in foreign exchange balances and in monetary gold, and in special drawing rights of the IMF.

### CURRENT ACCOUNT

(Accounts of goods and services and unrequited transfers. Items I.1 and I.2 in table VII/1)

The first part of this account (item 1) sums up the receipts and payments connected with the transfer of ownership of goods and with the rendering of services. The second part (item 2) sums up transfers which do not entail any obligations. In the goods

item, values are recorded f.o.b., i.e., without expenditure on transport and insurance. These services, if they are to be included in the balance of payments, are listed in the respective service items. (Until 1957, imports were listed on a c.i.f. basis). The data on imports and exports included in the National Accounts (Chapter VI) are defined differently; there the value of imports is given on a c.i.f. basis, i.e., including value of transport services provided by Israeli carriers to importers. These expenditures are offset there by recording this amount as exports of services.

Unrequited transfers are detailed in Table VII/1. Goods are specified in Chapters VIII (Foreign Trade) and XXVII (Judea, Samaria and Gaza Area).

Beginning with the 1977 data, amounts that were not registered according to the definitions have been subtracted: Duplicates were deducted from foreign trade (imports) and services.

Services are detailed in Table VII/2.

The data series in the item "travel" (Table VII/2) was revised in 1979, since the reports from the commercial banks, which served as the basis for the estimate, did not reflect accurately the activity in this item. The credit side was revised on the basis of person-nights spent by foreign tourists in Israel. The debit side was revised on the basis of the number of Israelis travelling abroad.

\* In cooperation with the Falk Project for Economic Research in Israel.

1 New definitions and classification — see introduction. 2 Exports f.o.b.; excluding factor payments from abroad. 3 Imports c.i.f.; excluding factor payments paid abroad. 4 Estimates for 1950—1979 at 1980 prices were computed for each group of expenditure and for the total expenditure by chaining the annual changes at base year prices. As a result of the chaining, the groups do not add up to the total. 5 A new series — using new sources for privat and general government consumption expenditure.
